# HOW SMART OBJECT WORK

Smart objects work like containers. All the different items can be placed inside the container.

You double click the Smart object in the Layers palette to access the contents of the object.

When you edit Photoshop layers, a separate document window will open with the contents of the Smart Object. This document will look and function the same as any other Photoshop document. You can freely edit the contents just like any in Photoshop.

When you have finished, choose close, and then save. The contents of the Smart object will be updated!
